Robustness has distinct claim owners

Client FedGVI: generalized variational updates combine a divergence and a loss. Bounded-loss influence claims require the

Robustness has distinct... (part 2)

source's matching model and regularity assumptions. KL/NLL with beta zero recovers the project-local Bayes update.

Robustness has distinct... (part 3)

Heuristic server: robust_aggregate discounts reports by disagreement with the emerging consensus. At robustness zero it exactly returns

Robustness has distinct... (part 4)

log_linear_pool. Recovery only; no transferred client theorem.

Robustness has distinct... (part 5)

Variational server: variational_aggregate alternates consensus and raw effective-weight updates on a stated objective.

Robustness has distinct... (part 6)

Descent and raw-weight bounds do not prove estimator B-robustness.
