

Client-loss comparison under label contamination

Composite NLL/L2=0.05 versus RCCE/L2=0.10 point-estimate proxy

peak_margin_contamination is selected within the displayed contamination sweep by maximum composite-configuration held-out accuracy margin; robust_loss_param and n_per are configured inputs, not selected by this report.

The joint change cannot identify an RCCE-only effect; no Alpha-Renyi objective, calibration, universal robustness, posterior uncertainty, or source-protocol replication is established.
