A model file must reach real execution

Untagged PDF derivative | HTML reader

A model file must reach real execution

A GNN model document is admitted through a pinned parser, or the packaged sentinel uses its source-bound cache. Validate

A model file must reach… (part 2)

dimensions, axis order, support, and model matrices before consumption.

A model file must reach... (part 3)

Native execution consumes GNN-derived A, B, C, D values through native_world and native_posterior. The sentinel

A model file must reach... (part 4)

exchange example compares extracted matrices against the native model.

A model file must reach... (part 5)

Optional upstream execution requires an explicit source root, qualified runtime and backend contract, followed by real execution and

A model file must reach… (part 6)

parity checks. Dashed arrows mark prerequisites, not a backend support or qualification claim.

A model file must reach... (part 7)

Receipts bind declared sources, inputs and outputs. Integrity evidence does not establish scientific validity. Parser success

A model file must reach… (part 8)

is not execution; matrix parity is not protocol replication; scientific conclusions still require appropriate models, controls and

A model file must reach... (part 9)

scoped evidence.
