

Expected-free-energy identity: additive cost and signed value views

Categorical specialization of Friston et al. (2024), Eq. 2

Signed waterfall: –epistemic is a negative correction;
 terminal endpoint is G (uniform prior makes information gain visible).

- terminal $G(\boldsymbol{\pi}) = 5.46$ nats
- pragmatic value
- epistemic correction $I(s; o | \boldsymbol{\pi})$
- risk $KL(q(o|\boldsymbol{\pi})\|p_C(o))$
- ambiguity $\mathbb{E}[H[p(o|s)]]$
